Had to stop working due to college **FYP**.

PROJECTS INVOLVED

Blood Bank Management System

 A web-based system developed solo using Node.js, designed to streamline blood donation, storage, and distribution processes. The platform allows donors to register, track their donations, and find nearby blood banks, while hospitals and blood banks can manage inventory, update availability, and process requests efficiently. Designed, developed, and implemented independently over 4-5 months, handling everything from UI/UX design to backend development and database management, ensuring a seamless and secure system.
